\*Tolerance : The device manufacturer/supplier shall assure process compatibility up to and including the stated classification temperature(this mean Peak reflow temperature + 0 °C. For example 260+ 0 °C ) at the rated MSL Level.

**Note 1:** All temperature reference topside of the package. The temperature is measured on the package body surface.

**Note 2:** The profiling tolerance is + 0 °C, - X °C (based on machine variation capability)whatever is required to control the profile process but at no time will it exceed – 5 °C. The producer assures process compatibility at the peak reflow profile temperatures defined in Table 8-3.

**Note 3:** Package volume excludes external terminals (balls, bumps, lands, leads) and/or non-integral heat sinks.

**Note 4:** The maximum component temperature reached during reflow depends on package the thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD package may still exist.

**Note 5:** Components intended for use in a “lead-free” assembly process shall be evaluated using the “lead free” classification temperatures and profiles defined in Table 8-1, 8-2, 8-3 whether or not lead free.
